

OLTP VS OLAP

① OLTP: Online Transactional Processing

- The fast ~~cash~~ cash register
- ↳ OLTP: Is the cash register at the front of the store. It has to be lightning fast.
- ↳ When buying at a store, cashier scans the goods; computer does a few quick jobs!
- Takes your money
- Changes store count from "10 toys left to 9 toys left"
- Prints your receipt.

OLTP cares about right now.
Handles thousands of tiny, fast actions every second.

② OLAP: Online Analytical Processing

- No cash register, just big desks & chalkboards.
- Big boss sits there end of the month & asks questions such as:
↳ Did we sell more toys in June or April?
↳ Which toys were more popular for boys.
↳ How much money did we make compared

OLTP: Is doing things fast (Front of the store).

OLAP: Is for thinking about things deeply (Back office)

DATA WAREHOUSE

- It is a single, giant computer folder where a company keeps ALL its history safe

- It is used to look back into old / past data and see if a company is growing, making more money or losing customers

- It works by putting everything into neat, matching boxes.

Box 1: The "What happened" box:

- Fast list of actions. Example
"Customer bought a shirt". "Customer bought shoes". "Customer bought a hat"

Box 2: The "Who & where" box

- This holds the details. Example
"Customer is Kago, lives in Greenside & likes the colour pink!"
