

2. SUM (The "ADD them all up" Machine)

What is it?

Imagine some of the toys are piggy banks & each has some coins inside.

SUM doesn't care how many piggy banks there are. Instead it breaks them open, dumps coins into one big pile, and **adds up the total amount of money.**

When to use it?

When the things you are looking at have **numbers** inside them that you want to add together

SYNTAX: SELECT SUM (coins)

FROM toy-box

"Go to the toy box, look inside every toy for coins, and add all those numbers together to give me one big number."

Example:

Sales

Sales-ID	customer-name	Category	Revenue
1	John	Electronic	120
2	Mary	Food	80
3	Elan	Electronic	150
4	Peter	Clothing	100

Write an SQL query to calculate the total revenue of each category.

SELECT category,

SUM (Revenue) AS total-revenue

FROM Sales

GROUP BY Category

Category	total-revenue
Electronics	270 (150+120)
Food	80
Clothing	100

* No distinct as we are NOT counting
We are using the SUM function to total the revenue, not to count it.
