

24 June 2026 - Joins

In a database house, we have multiple tables

Database house → Central data store

→ Has multiple data bases

DMS - data management system

SQL coding

We join multiple tables into one table

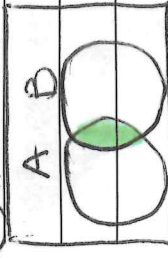

A **JOIN** is like a bridge.

It allows you to join or combine rows from two or more tables based on a related column between them.

↳ A SQL JOIN is meant to join multiple tables based on a **common column**

(a) INNER JOIN (The "Perfect Match")

→ Only grabs data if it exists on **both** tables (Strict RSVP list)

- We join tables on columns but the join affects the output row.
- When we join the table we can select any column between the tables we are joining.
- Returns rows where there is a match on both the tables.

SYNTAX

SELECT A. column 1,
A. column 2,
B. column 3,
B. column 4

FROM table 1 AS A

INNER JOIN table 2 AS B

ON A.common_column = B.common column

Customers

Cust-ID	name
1	Rajhi
2	Mballi

Orders

Order-ID	Cust-ID	Amount
101	1	500
102	4	20
103	5	10

SELECT cust_ID, name, amount

FROM customers AS A.

INNER JOIN Orders AS B

ON A.cust-ID = B.cust_ID
