Data Agent

→ Imagine you have a **BIG TOY BOX** full of all kinds: cars, dolls, blocks, balls. Now, whenever you want to play, it can be hard to find the right toy quickly.

A **data agent** is like a friendly **robot helper** who lives in your toy box:

- It listens when you say: "I want to play with cars."
- It looks through the entire box, finds all the cars, and brings them to you.
- It makes sure the toys are safe and not broken before giving them to you.
- It even remembers how to find them, so if someone asks later, it can explain.

So instead of you digging through the messy box, the robot does the searching, sorting and checking for you. That's what a data agent does with **information** instead of toys - it finds, organizes & explains data so people can use it easily.
