GROUP BY

Imagine you have a giant toy box filled with lots of different blocks. You have: red blocks, blue blocks and green blocks

GROUP BY statement says "All red blocks into this corner, all blue blocks go into that corner & all green blocks into another corner!"

Takes big messy list of data & puts the things that are the same into their own little groups.

↳ Used to collaborate identical data into groups

↳ Once toys are in groups, you need to tell SQL about the group:

- Count how many blocks are in each colour group
- Find out which group has the biggest block.

Examples:

At school: If you want to count how many kids are in **each** grade.

At shops: If you want to find out total money **per** type of fruit

Students

Student_ID	Name	Subject
101	Rafhi	Science
102	Jeff	Commerce
103	Mark	Commerce
104	Elon	Science
105	Steve	History
106	Donald	Commerce

aggrigated column

```
SELECT COUNT(Distinct student_ID)
    AS number_of_students,
  Subject - not aggrigated
            categorical column
FROM students
GROUP BY subject
```

↳ We commonly GROUP BY a categorical column

↳ Group BY column that is not aggrigated

Subject	number_of_students
Science	2
Commerce	3
History	1
